JOB #834 SHEET #2

G.I. = Galvanized Iron

The A.F.K.D

The Away From Keyboard Device is a unique device that is designed specifically with idea of a self-driving car in mind. Rather, instead of a car, this is a self-playing controller add on. With a programmable database, this device can be programmed to play just about any game.

The Support

After gathering some consumer intel and knowledge from my gaming friends, I found a few things that they felt would appeal to them:

- Universal controller compatibility
- Plug and play
- Compact design for portability

A Roadblock

An issue that I hit while brainstorming this product is quite a common one:

“Where am I going to get the money, resources, let alone the knowledge to build such a product.”

And on top of all that, I am quarantined at home with nothing but common household items.

A Convenient Opportunity

When this internship came along I was relieved to have gotten something that applied to my interests, making it a lot more enjoyable. Personally, I feel like this experience was better than my first choice, and I feel it was a stroke of luck that I got it.

The Design

It was after a few flaws and issues that I realized the product doesn't have to be a separate part to a controller, but rather an extension of this. So after some consumer advice, I realized that there almost always is some sort of port on controls that can be used as that extension.

The Prototype

After some careful consideration and limited resources, I sought it best simply to just create the framework instead of a full fledged prototype. In the end, what I imagined was eventually portrayed, and although it is incomplete, there are ways to improve it beyond this experience.

Who Would Buy It?

- Mostly console gamers that play with controllers
- PC gamers that play with controllers
- People who go “AFK” often
- Anyone who likes new gadgets
